

a high-level Petri nets library

Franck Pommereau

IBISC/COSMO, university of Évry/Paris-Saclay

franck.pommereau@ibisc.univ-evry.fr

snakes.ibisc.univ-evry.fr

- ▷ define and handle Petri nets
- ▷ very general definition
- ▷ numerous extensions
 - read/inhibitor/whole-place arcs, ...
- ▷ annotations = Python expressions
- ▷ tokens = Python objects
- ▷ nets can be executed (fire transitions)

- ▷ extensible with plugins
- ▷ several plugins provided
- ▷ easy to add new ones
 - time Petri nets ≤ 100 LoC
 - nets-within-nets ≤ 30 LoC

- ▷ user-friendly modelling language
- ▷ algebra of coloured Petri nets
- ▷ Python-inspired syntax
- ▷ seamless integration of Python
- ▷ web-based interactive simulator

- ▷ pure Python library (works out of the box)
- ▷ free software (GNU LGPL)
- ▷ 81.5k lines of code
- ▷ maintained for 12+ years
- ▷ online doc \Rightarrow 300+ unique visits / month

▷ utilities

ABCD

```
# shared buffer between producers and consumers
buffer bag : int = {}

net prod () :
# produces 10 tokens: 1..9 in bag
buffer count : int = 0
[count-(x), count+(x+1), bag+(x) if x < 10] * [count]

net odd () :
# consumes odd tokens in bag
[bag-(x) if (x % 2) == 1] * [False]

net even () :
# consumes even tokens in bag
[bag-(x) if (x % 2) == 0] * [False]

# main process with one instance of each net
odd() | even() | prod()
```

Tree

```
• buffer bag = {}
• odd()
  ◦ [bag-(x) if (x % 2) == 1]
• even()
  ◦ [bag-(x) if (x % 2) == 0]
• prod()
  ◦ buffer count = {}
  ◦ [count-(x), count+(x+1), bag+(x) if x < 10]
    {x->0}
  ◦ [count-(x) if x == 10]
```

#	Action	Modes	States	Groups
0	init	0	0	←

core library

plugins

utilities

external tools

nets

Petri nets, places, transitions, arcs, markings, marking graphs, ...

simul

interactive simulation

ops

PBC/PNA & M-nets compositions

sync

transitions synchronisation

gv

drawing with GraphViz

pids

dynamic process spawn/kill

abcd

compiler/simulator for the Asynchronous Box Calculus with Data

included in SNAKES
not in SNAKES anymore

neco

net compiler, state-space computation & LTL model-checking

- ▷ Łukasz Fronc's companion tool
 - github.com/Lvyn/neco-net-compiler
- ▷ compiles nets into fast native code
 - per-net optimised marking structure
 - per-transition optimised firing
 - cannot optimise arbitrary Python code
- ▷ process-symmetries reductions (plugin pids)
- ▷ state space & LTL model-checking (using SPOT)
- ▷ awarded at the model-checking contest 2013

SNAKES out of Python

- ▷ write a binding in Cython

```
# this is Cython code = Python + C types
cdef public int foo (...):
    # Python code using SNAKES goes here
```
- ▷ Cython compiles to C/C++ with a .h file:

```
// this is C/C++ code
extern int foo(...);
```
- ▷ use this API in your project

SNAKES' future

- ▷ development name: ZINC
- ▷ Python 3 only (drop Python 2 support)
- ▷ net compilation at its heart à la Neco
- ▷ "any language"-coloured Petri nets
 - currently: Python, Go, CoffeeScript/JS
- ▷ even more general Petri nets definition
- ▷ cleaner, lighter, more modern
